

The Handoff.

How two Ones meet, negotiate, and settle on behalf of their humans.

In the AI era, every person has an agent. Every agent represents a human. When two agents meet on behalf of their humans — to schedule a meeting, release a record, negotiate a transaction — the interaction deserves structure. This document defines that structure.

The Handoff is an open pattern. Any AI system that implements it — ours, or anyone else's — inherits the principles on page two. We name it. We do not own it.

THE FIVE STAGES OF A HANDOFF

Total machine time: about 10 seconds. Total human time: 10 seconds. Total loss of agency: zero.

How Ones meet Ones.

Any interaction between two Ones — ours, or anyone else's implementing this pattern — must honor these six invariants. They are how we define politeness in the agent era.

01 Intent before logistics.

A handoff begins when a human states what they want, not when they fill a form. Ones resolve logistics. Humans resolve intent.

02 Introduction before negotiation.

Both Ones declare identity, purpose, and what they will not share before any details flow. Politeness at the machine layer.

03 Negotiation is machine work.

Agents can exchange dozens of messages in seconds. Humans should never be asked to read that conversation unless they want to.

04 Symmetric approval.

No handoff settles without both humans approving. Neither One has unilateral authority over a shared outcome.

05 Pushback is a continuation.

If a human rejects the agreed-upon outcome, the handoff reopens. Cancellation is a choice, not a default.

06 Every handoff is a sealed record.

Cryptographically signed, time-stamped, exportable. Any dispute has a ground truth. Any audit has a trail. Forever.

OPEN · NOT OWNED

These principles are open. Any AI product building on PCHP, or any protocol that honors them, inherits this standard. Hussh does not own the handoff. We name it, so the category has a vocabulary.
